MOTOR DIMENSIONS

The bellow dimensions are for **comparison only**. The motors can obtain different flanges, shafts and end covers.

TMF28

TMF50

TMF100

Motor Advantages

1. Hardened shaft ensures long operation life under medium and shock load.
2. Robust radial - axial roller bearing, ensures motor capability for holding radial and axial load.
3. Solid swash plate.
4. Retainer plate, which holds piston group to swash plate without preload forces, ensures high starting torque.
5. Piston shoes with increased diameter ensures long operation life.
6. Improved pistons with increased length and large neck diameter ensure long motor life under high pressure.
7. Brass bushings reduce friction and generated temperature and ensure long operation life under high pressure and high speed of rotation.
8. Hardened steel cylinder block ensures long operation life under medium and shock load.
9. Bimetal distributor plate reduce friction and generated temperature and ensures long operation life under high pressure and high speed of rotation.
10. Needle bearing - ensures motor capability for holding radial load.
11. Solid end cover ensures long operation life under high pressure.

The main advantage of design is that it provides a guaranteed minimal clearance between the elements of the axial piston group without constant preload forces. This advantage reduces the losses from the friction and provides higher starting torque. Using brass bushings and bimetal distributor plate reduced friction and allows higher revolutions of work, less heating of the motor and the oil. At the same time the reduced wearing out provides the longer motor life. Other improvements are in pistons and piston shoes. The pistons are longer with large neck diameter in that way ensure long operation life under high pressure. The piston shoes are with increased diameter ensuring long operation life.

These improvements in design of the TMF motor gain big advantage over the typical swash plate motors. The starting torque is close to the starting torque of the bent axis motors and the total efficiency of design in normal working modes is similar to the bent axis motors. The main advantage of design over the bent axis motors is that the pulsations and vibrations during the operation are much less. Another advantage is that the swash plate motors are more reliable than the bent axis motors.

SPECIFICATION DATA

Type	TMF 22	TMF 28
Displacement, cm.³/rev.	22.15	28.47
Max. Speed, RPM	Cont. 4200 Int.* 4700	4200 4700
Max. Torque,*** Nm	Cont. 123 Int.** 148	159 190
Output, kW	Cont. 37 Int.** 54	48 70
Max. Pressure, bar	Cont. 350 Int.** 420	350 420
Max. Oil Flow, lpm	Cont. 93 Int.* 104	120 134
Permissible Shaft Load		
max Axial**** N	Fa=1300	
max Radial**** N	Fr=2200	
Min. Speed, RPM	500	
Max. Pressure in Drain Line, bar	5 open drain line is always required	
Weight, kg	11.3	

* Intermittent speed (flow): for pressure up to 150 bar;

** Intermittent load: the permissible values may occur for max. 10% of every minute;

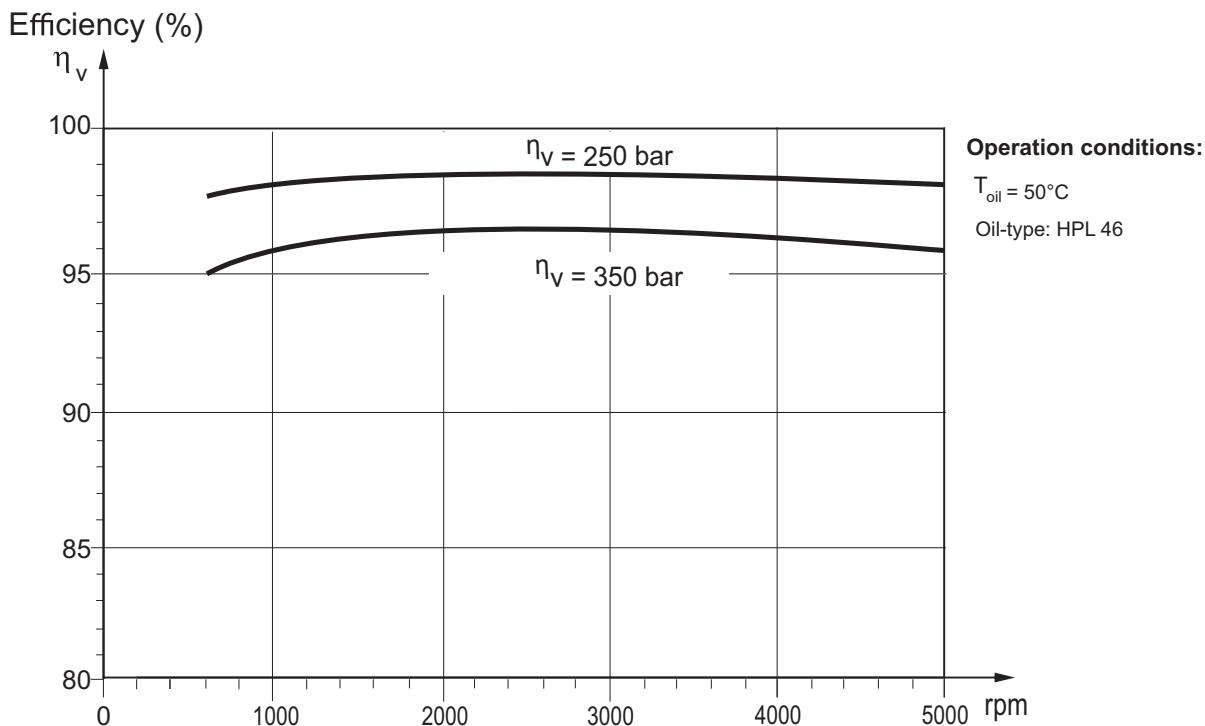

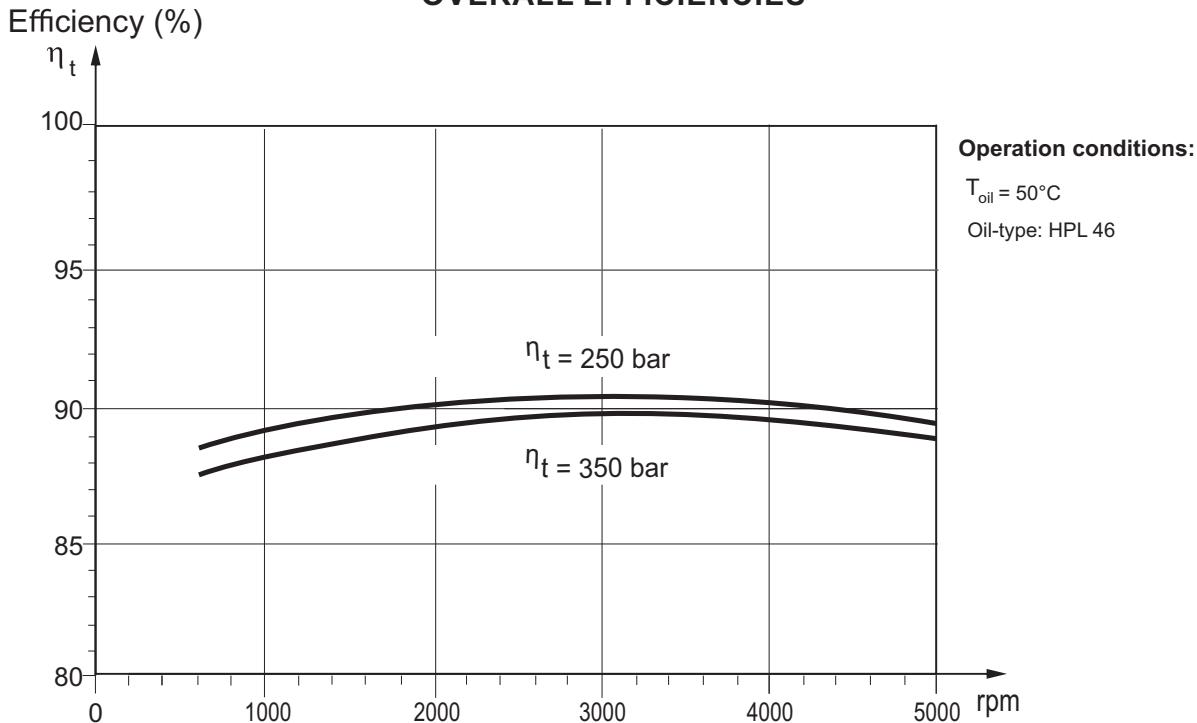

*** Theoretical torque;

**** The calculated max values are based on the optimal direction of the forces Fr, Fa and optimal position of the shaft.

1. The recommended output power for continuous operations should not be exceeded.
2. Recommended filtration as per ISO 4406 cleanliness code 18/16/13 or better. This filtration corresponds to SAE AS 4059 8A/7B/7C. Nominal filtration - 10 micron or better.
3. Recommended a premium quality, anti-wear type mineral based hydraulic oil, HLP (DIN 51524) or HM (ISO 6743/4).
4. Recommended oil viscosity - 12...68 cSt or see page 37.
5. Recommended maximum system operating temperature -82°C.
6. To ensure optimum life of the motor, fill it up with fluid prior to load it and run with moderate load and speed for about 10-15 minutes.

FUNCTION DIAGRAMS

The below efficiencies are applied for all displacements.

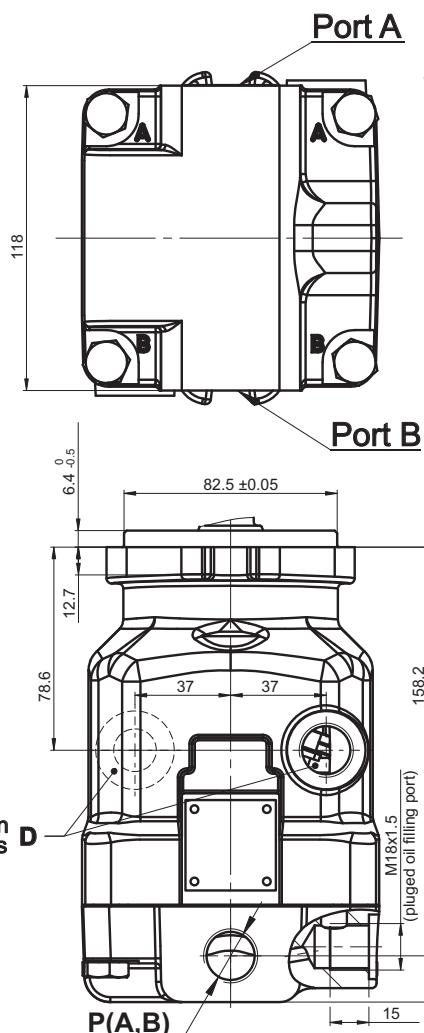

VOLUMETRIC EFFICIENCIES**OVERALL EFFICIENCIES**

The motor size, pressure, torque, speed of rotation and flow rate required for a specific application can be calculated using the formulas on page 38.

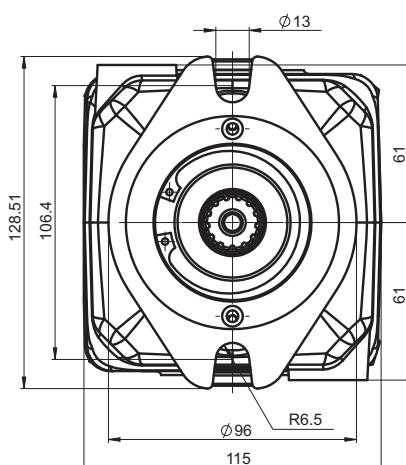

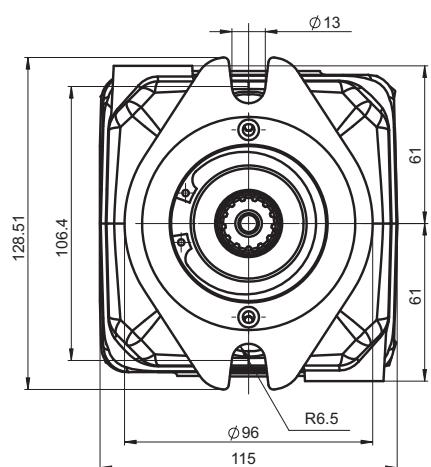

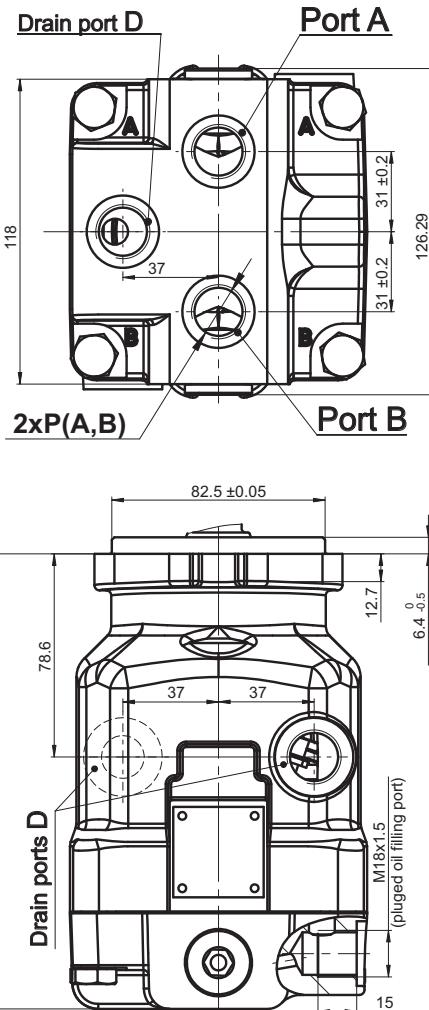

Efficiencies for a particular motor may vary from the shown in the diagram depending on the operating conditions.

Parallel key A8x7x25 DIN6885
CM* - ø25.4 Straight, M8-6H thread
Parallel key 1/4"x1/4"x1" BS46

* Shaft type CM is available only for Pos. 5 option N

** The permissible output torque for shafts must not be exceeded!

Pos.8 - Integrated Valves

See next page for information about valves
omit - None

- FLU** - Flush valve

- DAR** - Dual anti-cavitation and relief valve
(Option DAR are not available for Pos. 2
option E)

Pos.9 - Pressure Setting of Integrated Valves

omit - None

- x** - For value - see next page

Pos.10 - Flow Setting of Integrated Valves

omit - None

- Lx** - For value - see next page

Pos.5 - Improved radial load

omit - standard bearing

- N** - Improved bearing

Pos.6 - Port Size

- 2** - 2xG1/2, drain ports G1/2
6 - 2xG3/4, drain ports G1/2

Pos.7 - Seal, Corrosion Resistant Seal Surface

omit - NBR seal type material

- V** - FKM seal type material

TMF 28 Motors Series

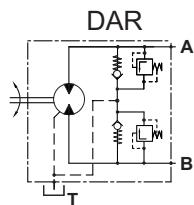

Valve Options

The overall dimensions of the motor with integrated valves could vary compared to the standard motors.

Option DAR

Combined Anti-Cavitation and Reliev Valve

- Anti-cavitation check valve is used for applications such as Fan drive control;
- Pressure relief valves prevent excessive pressures in the high pressure loop.

Please, consider the following possible values:

Pos.8 **250** **300** **350** → pressure

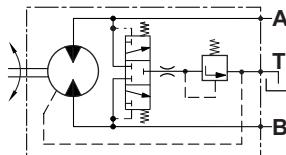

EXAMPLE

TMF B 28 S D 2 D A R 3 5 0

Double Anti-Cavitation and Relief Valve, relief valve setting 350 bar

Option FLU

FLUSH VALVE

- Mainly used in close loop circuit;
- The valve is a combination between a purge valve and check valve;
- Flow rate by default (omit) - 3 ÷ 7 lit/min and charge (opening) pressure 16 bar with 20 bar feed pressure for close loop circuit;
- For other options, please see Pos.8 and Pos. 9 of ordering code, considering the following possible values:

Pos.8 **omit** **10** → pressure

Pos.9 **omit** **L3.5** **L5.5** → flow rate

EXAMPLE

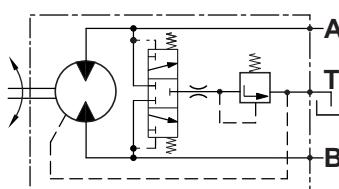

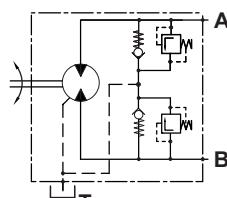

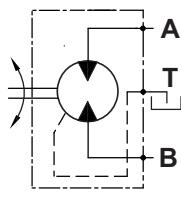

TMF B 28 S D 2 F L U flow rate 5±2 lit/min,
charge pressure 16 bar

TMF B 28 S D 2 F L U 10 L 5 . 5 flow rate 5.5±1 lit/min,
charge pressure 10 bar

TMF B 28 S D 2 F L U L 3 . 5 flow rate 3.5±1 lit/min,
charge pressure 16 bar

** Intermittent load: the permissible values may occur for max. 10% of every minute.

*** Theoretical torque

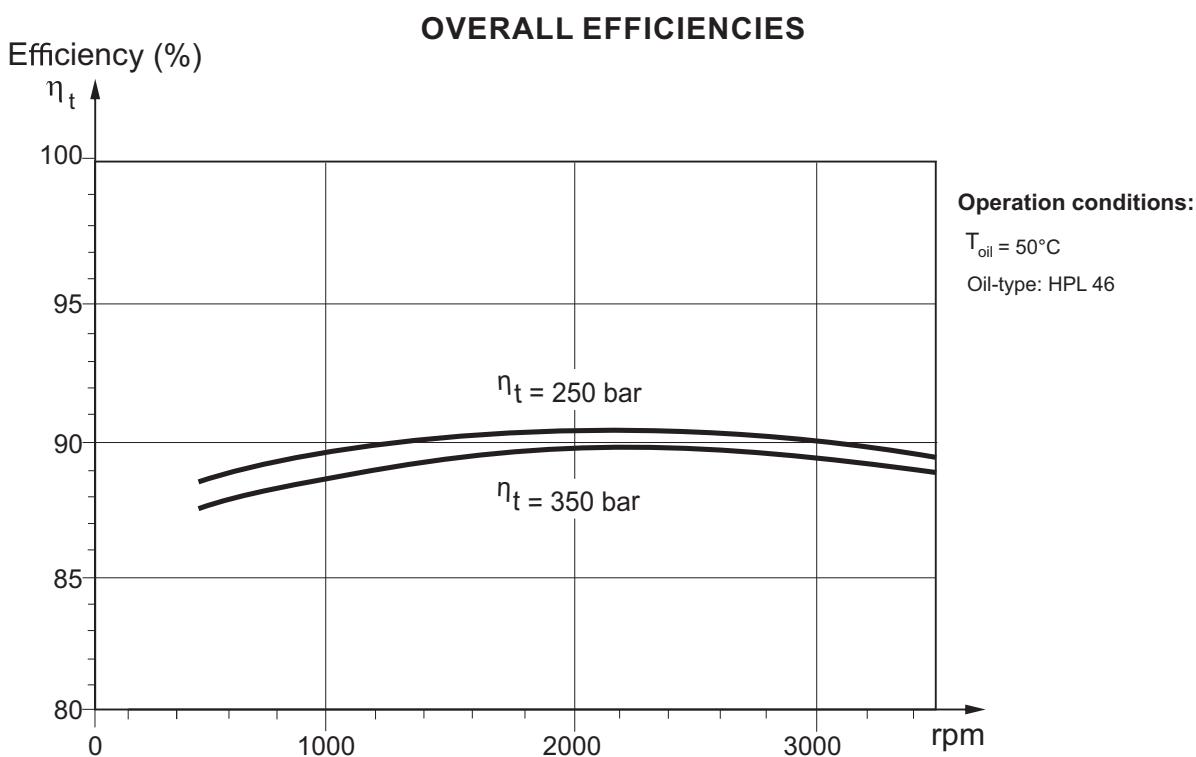

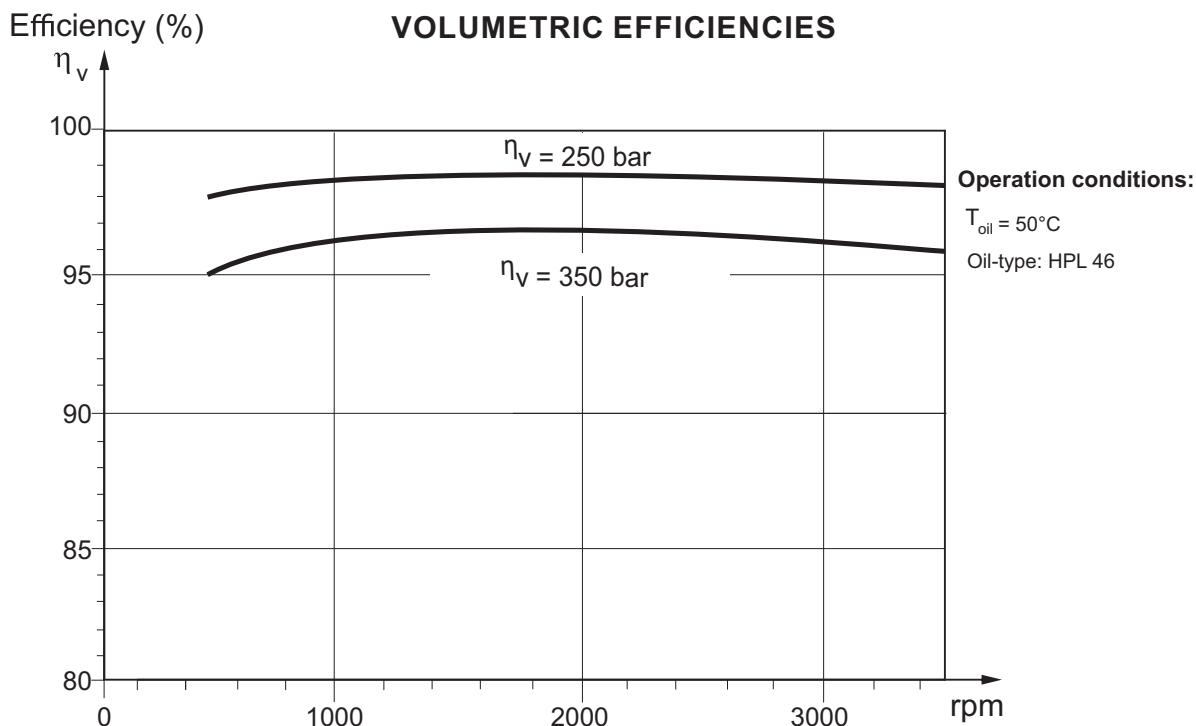

**** The calculated max values are based on the optimal direction of the forces Fr, Fa and optimal position of the shaft.

1. The recommended output power for continuous operations should not be exceeded.
2. Recommended filtration as per ISO 4406 cleanliness code 18/16/13 or better. This filtration corresponds to SAE AS 4059 8A/7B/7C. Nominal filtration - 10 micron or better.
3. Recommended using of a premium quality, anti-wear type mineral based hydraulic oil, HLP(DIN51524) or HM(ISO6743/4).
4. Recommended oil viscosity - 15...30 cSt or see page 37.
5. Recommended maximum system operating temperature 80°C.
6. To ensure optimum life of the motor, fill it up with fluid prior to load it and run with moderate load and speed for about 10-15 minutes.

TMF 100 Motors Series

FUNCTION DIAGRAMS

The below efficiencies are applied for all displacements.

The motor size, pressure, torque, speed of rotation and flow rate required for a specific application can be calculated using the formulas on page 38.

Efficiencies for a particular motor may vary from the shown in the diagram depending on the operating conditions.

TMF 100 Motors Series

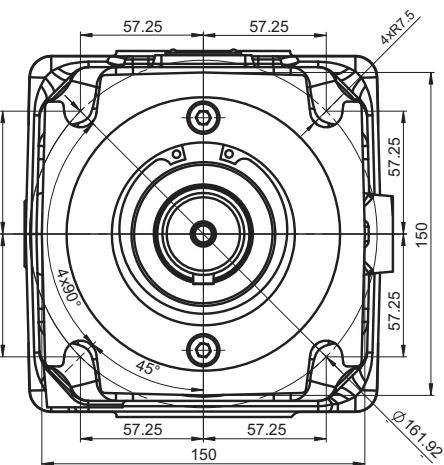

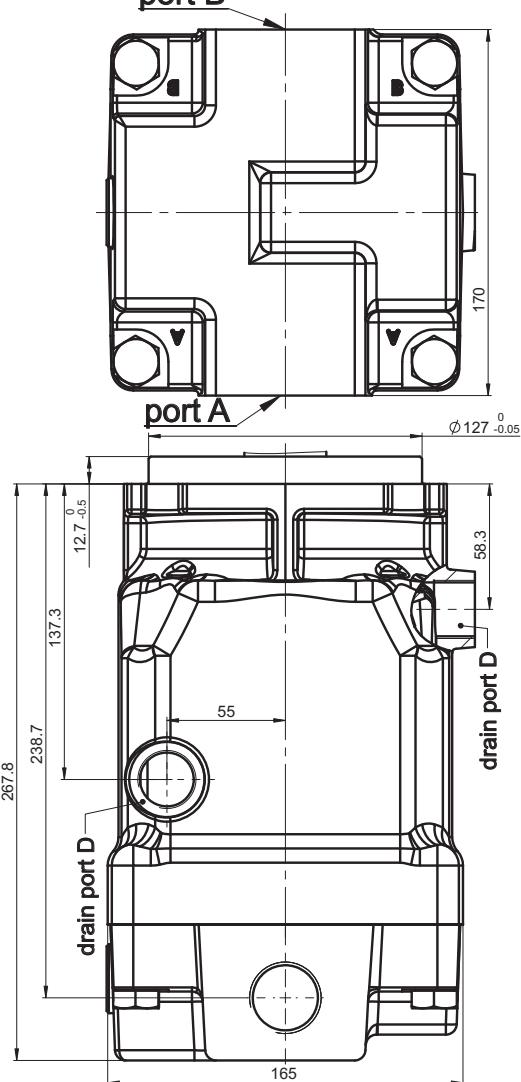

Overall Dimensions and Ports

Side Ports - Default Mounting Flange - Type SAE-4C

Side ports, port size 2

See the port sizes at the bottom of this page

port B

	Port Size
P _(A,B)	2xG 1
D	G 3/4

Rear ports E, port size 2

See the port sizes at the bottom of this page

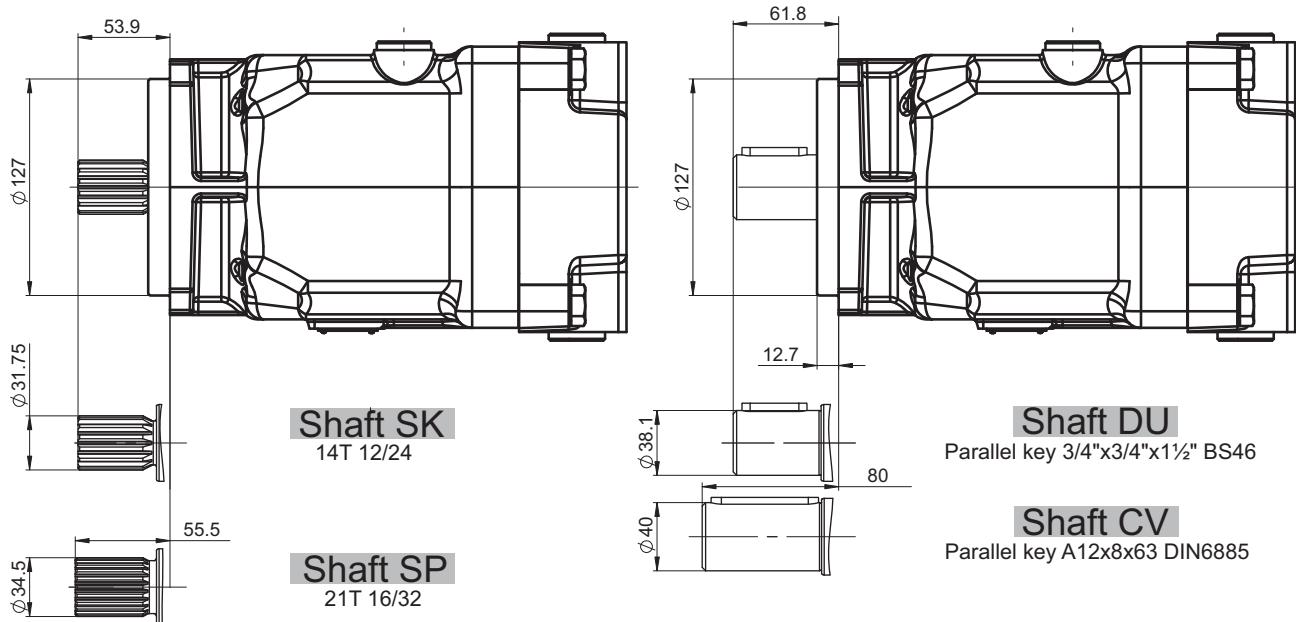

port B

drain port D2

	Port Size
P _(A,B)	2
D1	G 3/4
D2	G 1/2

TMF 100 Motors Series

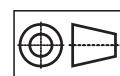

Shafts Mounting
Flange - Type SAE-4C

Shaft Dimensions
See Page 32+33

PERMISSIBLE SHAFT LOAD

Permissible shaft load		
max Axial	N	F _a =2500
max Radial	N	F _r =4500

The calculated max values are based on the optimal direction of the forces F_r, F_a and optimal position of the shaft (see page 34).

SP - Ø34.5 Spline SAE 21T 16/32 DP, M12
DU - Ø38.1 Straight, key 9.528
L38.1, 3/8-16 UNC thread
CV - Ø40 Straight, M12-6H thread
Parallel key A12x8x63 DIN6885

** The permissible output torque for shafts
must not be exceeded!

Pos.5 - Ports

- 2** - 2xG1, drain G3/4, for rear drain ports G1/2

Pos.6 - Seal, Corrosion Resistant Seal Surface

- omit - NBR seal type material
V - FKM seal type material

TMF 100 Motors Series

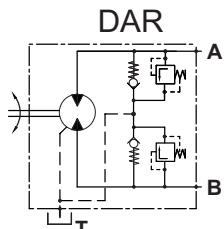

Valve Options

The overall dimensions of the motor with integrated valves could vary compared to the standard motors.

Option DAR

Combined Anti-Cavitation and Reliev Valve

- Anti-cavitation check valve is used for applications such as Fan drive control;
- Pressure relief valves prevent excessive pressures in the high pressure loop.

Please, consider the following possible values:

Pos.8 **250** **300** **350** → pressure

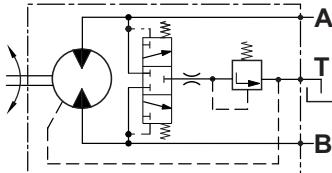

EXAMPLE

TMF4C100ST2DAR350

Double Anti-Cavitation and Relief Valve, relief valve setting 350 bar

Option FLU

FLUSH VALVE

- Mainly used in close loop circuit;
- The valve is a combination between a purge valve and check valve;
- Flow rate by **default (omit)** - **5 ÷ 9 lit/min** and **charge (opening) pressure 16 bar** with 20 bar feed pressure for close loop circuit;
- For other options, please see Pos.8 and Pos. 9 of ordering code, considering the following possible values:

Pos.8 **omit** **10** → pressure

Pos.9 **omit** **L5.5** **L9** → flow rate

EXAMPLE

TMF4C100ST2FLU → flow rate 7 ± 2 lit/min,
charge pressure 16 bar

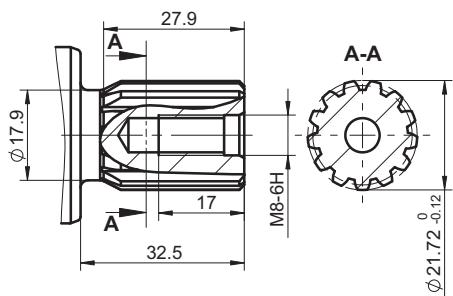

TMF4C100ST2FLU10L5.5 → flow rate 5.5 ± 1 lit/min,
charge pressure 10 bar

TMF4C100ST2FLUL9 → flow rate 9 ± 1 lit/min,
charge pressure 16 bar

Port A Pressurized - CW
Port B Pressurized - CCW

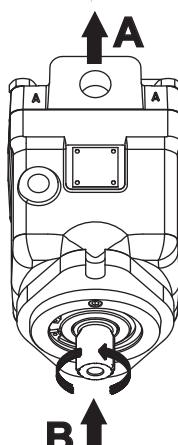

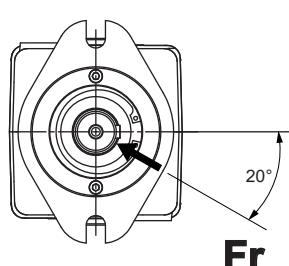

BEST POSITION FOR APPLYING RADIAL LOAD

Optimal position for applying radial load depending on the direction of rotation

Standard Rotation

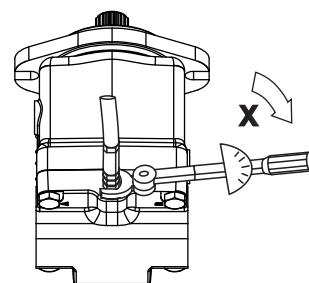

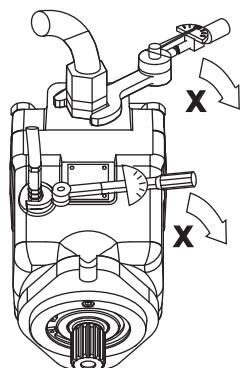

Reverse Rotation

INSTALLATION

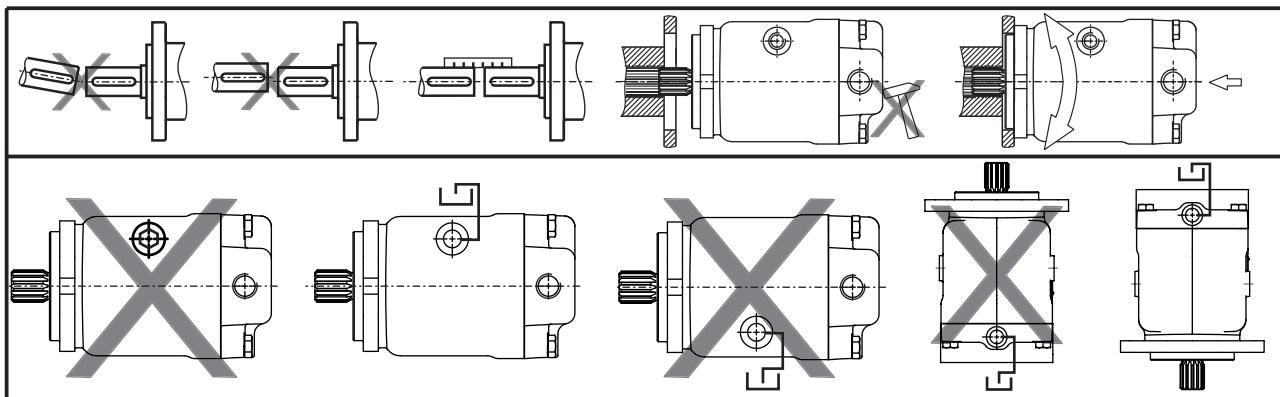

Recommended max. tightening torque X for metal plugs and orifice

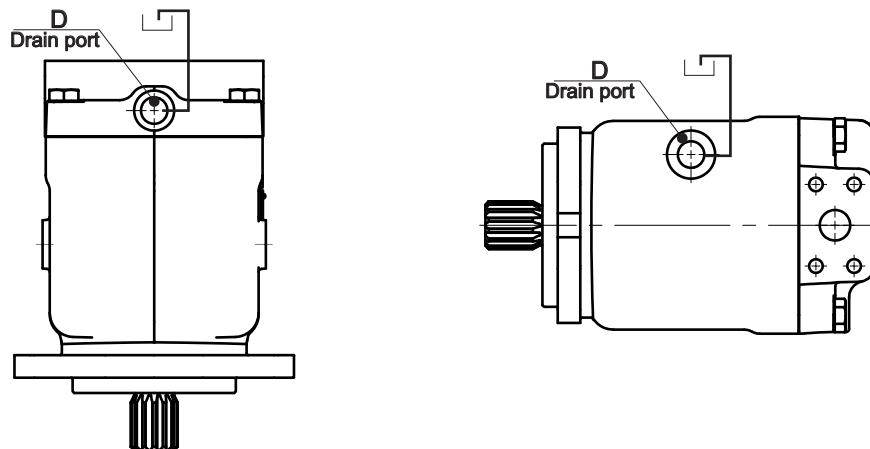

Screwed connection	Max. Tightening Torque X, daNm			
	With copper washer	With aluminium washer	With cutting edge	With "O" ring
G 1/4	2	3	4	2
G 3/8	2	5	6	2
G 1/2	3	8	10	3
G 3/4	5	13	16	5
G 1	8	20	25	8

INSTALLATION

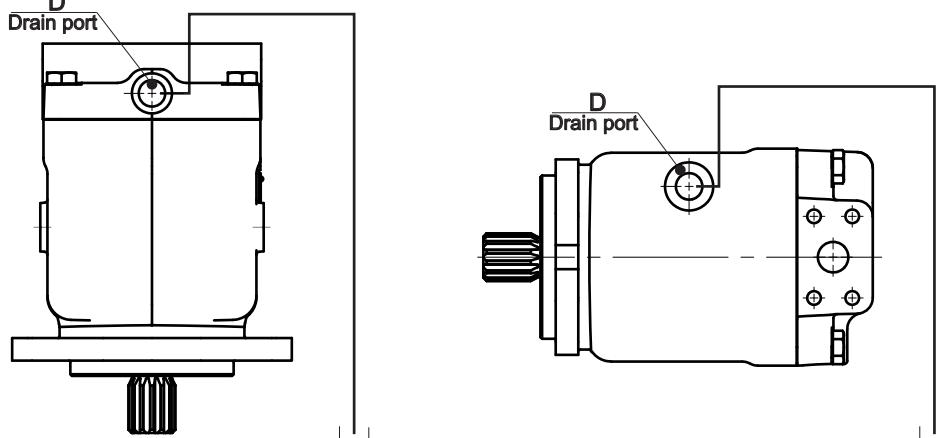

At start-up and during operation the motor (pump) housing has to be filled up with hydraulic fluid. Start-up has to be carried out at low or moderate speed and without load (for example 1000 rpm and pressure 50 bar till the motor (pump) and the hydraulic scheme are filled up with oil. Generally the start-up needs 10-15 minutes to finish. The leakage oil in the housing has to be discharged to the tank through the highest positioned drain port D. The max. pressure in the drain line is 5 bar.

**Installation below the tank level (recommended)**

- Fill up the axial piston motor (pump) before the start-up through the highest positioned drain port D;
- Operate the motor (pump) at low speed till the motor system is completely filled up;
- The minimum immersion depth of the drain line in the tank is 200 mm relative to the minimum oil level in the tank.

**Installation on top of the tank level**

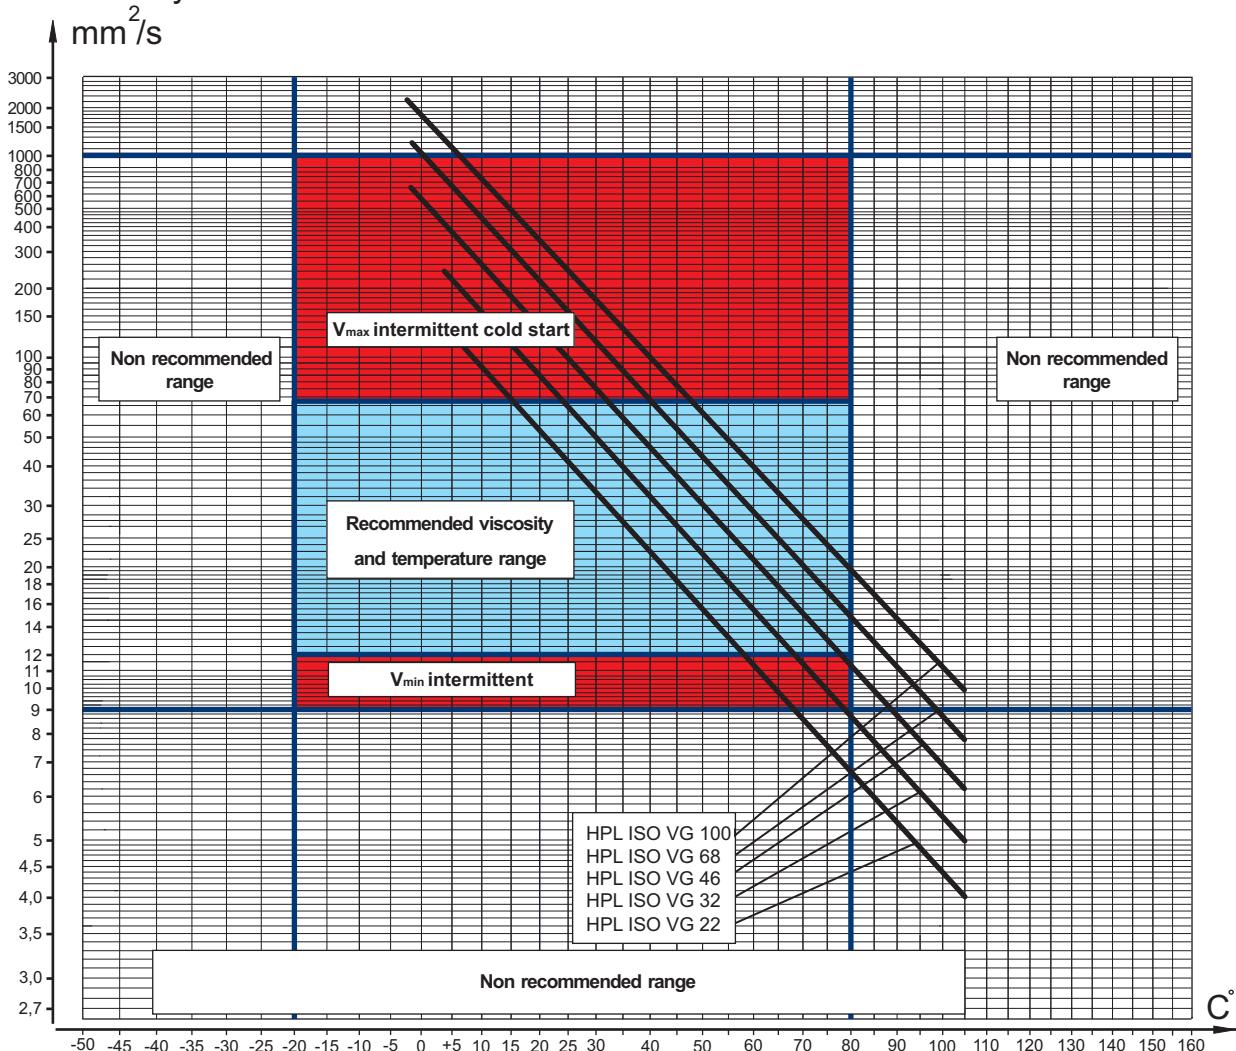

- Fill up the axial piston motor (pump) before the start-up through the highest positioned drain port D;
- Operate the motor (pump) at low speed till the motor system is completely filled up;
- The minimum immersion depth of the drain line in the tank is 200 mm relative to the minimum oil level in the tank.

Fluid Viscosity Limits

In order to obtain optimum efficiency and service life, we recommend to select the operating viscosity (at operating temperature) within the range shown on diagram below.

Kinematic viscosity

Temperature

The above - shown viscosity characteristics are for reference only. Please, check the actual viscosity with the manufacturer of the fluid.

Basic Formulas

The motor(pump) size, pressure and flow required for a specific application can be calculated using the formulas below.

Metric System

$$\text{Efficiency} \quad \eta_t = \eta_{mh} \cdot \eta_v \quad \eta_{mh} = \frac{\eta_t}{\eta_v} \quad \eta_v = \frac{\eta_t}{\eta_{mh}}$$

$$\text{Input flow (for Motor)} \quad Q = \frac{Vg \cdot n}{1000 \cdot \eta_v} \quad [\text{l/min}]$$

$$\text{Output torque (for Motor)} \quad M = \frac{Vg \cdot \Delta p \cdot \eta_{mh}}{62.8} \quad [\text{Nm}]$$

$$\text{Output power (for Motor)} \quad P = \frac{M \cdot n}{9550} = \frac{Q \cdot \Delta p \cdot \eta_t}{60} \quad [\text{kW}]$$

$$\text{Speed (for Motor)} \quad n = \frac{Q \cdot 1000 \cdot \eta_v}{Vg} \quad [\text{min}^{-1}]$$

$$\text{Output flow (for pump)} \quad Q = \frac{Vg \cdot n \cdot \eta_v}{1000} \quad [\text{l/min}]$$

$$\text{Driving torque (for pump)} \quad M = \frac{Vg \cdot \Delta p}{62.8 \cdot \eta_{mh}} \quad [\text{Nm}]$$

$$\text{Input power (for pump)} \quad P = \frac{M \cdot n}{9550} = \frac{Q \cdot \Delta p}{60 \cdot \eta_t} \quad [\text{kW}]$$

Vg = Displacement per rev. [cm³]

Δp = p_{HP} - p_{LP} [bar]

p_{HP} = High pressure [bar]

p_{LP} = Low pressure [bar]

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

η_t = Overall efficiency

Application Formulas
Motor speed: n

$$n = \frac{2,65 \cdot v_{km} \cdot i}{R_m}$$

v_{km} - vehicle speed [km/h]

R_m - wheel rolling radius [m]

i-gear ratio between motor and wheels.

If no gearbox, use i=1.

Total tractive effort: TE, N

Total tractive effort **TE** is the total effort necessary for vehicle motion i.e. the sum of the calculated forces increased by 10 % because of air resistance.

$$TE = 1,1 \cdot (RR + GR + FA + DP)$$

RR - force required to overcome the rolling resistance

GR- force required to slope upwards

FA- force required to accelerate (acceleration force)

DP- additional tractive effort (trailer)

Motor Torque moment: M, Nm

Necessary torque for the hydraulic motor:

$$M = \frac{TE \cdot R_m}{N \cdot I \cdot \eta_M}$$

I- motor numbers

η_M - mechanical gearbox efficiency (if it is available)

Radial motor loading: P_{rad} , N

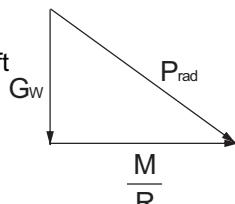

When the motor is used for motion with a ring or gear mounted directly on the motor shaft, the total radial load of the motor shaft **P_{rad}** is the sum of the motion force and the weight force acting on ring.

G_w - Weight held by the shaft

P_{rad} - Total radial load of the motor shaft

M/R- Motion force

$$P_{rad} = \sqrt{G_w^2 + \left(\frac{M}{R}\right)^2}$$

Depending on the results of the load calculations, the most appropriate type of motor from the catalogue is selected.

As HANSA-TMP has a very extensive range of products and some products have a variety of applications, the information supplied may often only apply to specific situations.

If the catalogue does not supply all the information required, please contact HANSA-TMP.

In order to provide a comprehensive reply to queries we may require specific data regarding the proposed application.

Whilst every reasonable endeavour has been made to ensure accuracy, this publication cannot be considered to represent part of any contract, whether expressed or implied.

The data in this catalogue refer to the standard product. The policy of HANSA-TMP consists of a continuous improvement of its products. It reserves the right to change the specifications of the different products whenever necessary and without giving prior information.
