

# PF2

## High Pressure In-line Filter Assembly

Ideal for a variety of applications including mobile applications, paper and saw mills, power generation, general industrial machine tools, and automotive manufacturing. With HF2 compatible port-to-port dimension, mounting pattern, and element design to meet the automotive manufacturing standard.

**Max Operating Pressure: 4000 psi (275 bar)**

## Elements that go beyond industry standard.

G8 Dualglass and PE glass elements are DFE rated to assure performance even when exposed to the toughest hydraulic systems and provide unmatched particulate capture and retention to remove contamination from your hydraulic and lube oils, for good.

## Small size, huge results.

The compact size of PF2 filter assemblies make them the perfect addition directly upstream of your control valves and other sensitive components even in the tightest of spaces. And with two different mounting options to choose from, the incredible versatility of the PF2 makes it ideal for all of your high pressure filter applications.

## Works under pressure.

Applications for the PF2 include mobile, general industrial machine tools, paper mills, sawmills, and speed control circuits for power generation systems. So whether you're operating waste haulers, cement mixers, fire trucks, cranes, or CNC routers, you can be sure the PF2 will protect your critical components even when the pressure is on.

Filter Assembly Sizing <sup>1</sup>	Filter assembly clean element ΔP after actual viscosity correction should not exceed 10% of filter assembly bypass setting. For applications with extreme cold start condition contact Hy-Pro for sizing recommendations.											
	Step 1: Calculate ΔP coefficient for actual viscosity											
	<div style="border: 1px solid black; padding: 5px;"> <p><b>Using Saybolt Universal Seconds (SUS)</b></p> <math display="block">\Delta P \text{ Coefficient} = \frac{\text{Actual Operating Viscosity}^1 \text{ (SUS)}}{150} \times \frac{\text{Actual Specific Gravity}}{0.86}</math> </div>	or	<div style="border: 1px solid black; padding: 5px;"> <p><b>Using Centistokes (cSt)</b></p> <math display="block">\Delta P \text{ Coefficient} = \frac{\text{Actual Operating Viscosity}^1 \text{ (cSt)}}{32} \times \frac{\text{Actual Specific Gravity}}{0.86}</math> </div>									
	Step 2: Calculate actual clean filter assembly ΔP at both operating and cold start viscosity											
	<div style="border: 1px solid black; padding: 5px;"> <math display="block">\text{Actual Assembly Clean } \Delta P = \text{Flow Rate} \times \Delta P \text{ Coefficient (from Step 1)} \times \text{Assembly } \Delta P \text{ Factor (from sizing table)}</math> </div>

<sup>1</sup>Vent connection standard on G12 and S12 models - #4 SAE.

<sup>2</sup>Maximum recommended flow rate based on velocity through port and internal flow path. Consult sizing guidelines or consult factory for sizing based on flow rate, viscosity, temperature, filter media selection.

<sup>3</sup>When chosen, must be paired with Bypass option "4"

<sup>4</sup>Compatible only with High Collapse Rating option "1."

<sup>5</sup>Not available on High Collapse Rating option "1."
